

Why Refurbish, Recondition and/or Polish Concrete?

Some people have been unhappy with certain characteristics of concrete floors for as long as they have been around. They often "dust", they are porous so they stain easily, the plain gray color is flat and unappealing and they can wear from heavy foot or vehicular traffic. Until recently, the only way to address these problems was to cover the concrete floor. Rugs, tile, hardwood flooring, paint and epoxy have all been used with varying degrees of success to cover the concrete problems. The location in the house partially determines what can be used and what can't. For example, you would not cover a garage floor with carpeting or hardwood flooring. But people have used paint or pigmented epoxy for years to brighten the room, stop the dusting and make the floor easier to clean and resist stains.

The problem with paint as a concrete covering is that it quickly peels off and requires yearly re-coating. Epoxy does better, but it is a topping that can still delaminate if moisture is coming up through the floor. It is much like plastic; it can scratch easily and/or melt away when it gets heated up. This is where concrete reconditioning, refurbishing and polishing fits in.

Concrete Edging Made Easy

Grinding concrete, removing a coating, leveling high spots, smoothing rough, textured areas and/or polishing the EDGES of a concrete surface have been a long-time challenge for most contractors. How do you get all the way tight against a wall or other vertical surface? How do you get under something or get into a tight space? People have been dealing with these issues for a long time with varying degrees of success. The edges usually present a problem that contractors don't want to deal with. Some have spent hours and hours on their hands and knees with an angle grinder fixing problems or smoothing the concrete; some have painted the edges by framing out the area; some get as close as they can and let the edges go. Now there's a simple solution. We'd like to introduce you to "The Edge" concrete edge polisher and high-speed grinder by CONTRx Systems. This unit will get those hard to reach places **FASTER, EASIER**, and more **EFFICIENTLY** without being on your hands and knees.

NO MORE FRAMING
NO MORE EDGE TINT
NO NEED TO PAINT
NO NEED TO TAPE OFF
NO NEED TO BE ON YOUR HANDS & KNEES

STAND UP AND GET TIGHTLY AGAINST ANY VERTICAL SURFACE WITH EASE

This multi-purpose machine will Truly Take You To The Edge! It can be used as a polishing machine which is portable, easy to use and perfect for polishing around columns, along walls, other vertical surfaces as well as in tight areas. The 7" working width will polish 500-600 lineal feet per hour. It comes standard with a 4-postion handle and a 4-postion dust shroud allowing for maximum operator control. As a polishing unit, it comes standard with a flex-head assembly that enables it to follow the contours of any concrete surface.

This high-speed unit can double as an aggressive turbo grinding machine when equipped with a rigid head assembly and diamond grinding cup wheel. It's still portable, easy to use and will grind tightly against the wall while grinding the same 500-600 lineal feet per hour, but at about a 1/16" with a diamond cup wheel. When equipped with a diamond cup wheel, you can remove coatings, build-ups, high spots, markings, overlays, paints and more.

Whether you're just starting out, have been polishing for years, need to remove coatings, smooth the surface or just need a better way to handle the edges, "The Edge" from CONTRx Systems makes it easy! Get the ultimate edging machine today.
